

### AMENDMENTS TO THE CLAIMS

This listing of claims replaces all prior versions, and listings, of claims in the application:

1           1.       (Currently Amended) A method of dynamically protecting access to a first  
2 network, comprising:  
3               receiving, in a system, a data unit containing a source address indicating a source  
4 of a data unit;  
5               matching the source address with information stored in the system; and  
6               enabling entry of the data unit to the first network for communication to a  
7 destination device on the first network if the source address matches the information stored in the  
8 system and denying entry of the data unit to the first network if the source address does not  
9 match the information stored in the system,  
10              wherein the destination device is separate from the system.

1           2.       (Original) The method of claim 1, wherein matching the source address with the  
2 information comprises matching the source address with one or more entries of a network  
3 address translation mapping table.

1           3.       (Original) The method of claim 1, wherein matching the source address  
2 comprises matching an Internet Protocol address.

1           4.       (Currently Amended) ~~The method of claim 1,~~ A method of dynamically  
2 protecting access to a first network, comprising:  
3               receiving, in a system, a data unit containing a source address indicating a source  
4 of a data unit;  
5               matching the source address with information stored in the system; and  
6               enabling entry of the data unit to the first network if the source address matches  
7 the information stored in the system and denying entry of the data unit to the first network if the  
8 source address does not match the information stored in the system,  
9               wherein receiving the data unit comprises receiving a data unit containing media  
10 associated with a call session.

1           5.     (Currently Amended) ~~The method of claim 1, further comprising~~ A method of  
2 dynamically protecting access to a first network, comprising:  
3                 receiving, in a system, a data unit containing a source address indicating a source  
4 of a data unit;  
5                 matching the source address with information stored in the system;  
6                 enabling entry of the data unit to the first network if the source address matches  
7 the information stored in the system and denying entry of the data unit to the first network if the  
8 source address does not match the information stored in the system; and  
9                 determining if the data unit contains a payload according to a predetermined  
10 protocol, and denying entry of the data unit if the data unit does not contain payload according to  
11 the predetermined protocol.

1           6.     (Original) The method of claim 5, wherein determining if the data unit contains a  
2 payload according to the predetermined protocol comprises determining if the data unit contains  
3 a payload according to a Real-Time Protocol or Real-Time Control Protocol.

1           7.     (Currently Amended) ~~The method of claim 1, further comprising~~ A method of  
2 dynamically protecting access to a first network, comprising:  
3                 receiving, in a system, a data unit containing a source address indicating a source  
4 of a data unit;  
5                 matching the source address with information stored in the system;  
6                 enabling entry of the data unit to the first network if the source address matches  
7 the information stored in the system and denying entry of the data unit to the first network if the  
8 source address does not match the information stored in the system; and  
9                 storing profile information for each a call session, and determining if an  
10 unauthorized access of the first network is occurring based on the profile information.

1           8.       (Original) The method of claim 7, wherein storing the profile information  
2 comprises storing a threshold representing a maximum acceptable rate of incoming data units  
3 from an external network to the first network.

1           9.       (Original) The method of claim 8, further comprising calculating a value for the  
2 threshold based on a frame size used in the call session.

1           10.      (Original) The method of claim 8, wherein storing the profile information further  
2 comprises storing a pattern expected in incoming data units.

1           11.      (Original) The method of claim 10, wherein storing the pattern comprises storing  
2 a codec type used in the call session.

1           12.      (Original) The method of claim 8, further comprising generating an alarm if the  
2 system detects a rate of incoming data units from the external network to the first network  
3 exceeding the threshold.

1           13.      (Original) The method of claim 8, further comprising denying further transport of  
2 incoming data units from the external network to the first network for the call session if the  
3 system detects a rate of incoming data units from the external network to the first network  
4 exceeding the threshold.

1           14.      (Currently Amended) An article comprising at least one storage medium  
2 containing instructions for protecting a first network, the instructions when executed causing a  
3 system to:  
4                   determine if a rate of incoming data units from an external network to the first  
5 network exceeds a predetermined threshold in a given call session; and  
6                   perform a security action if the determined rate of incoming data units exceeds the  
7 predetermined threshold.

1           15.   (Cancelled)

1           16.   (Currently Amended) The article of claim [[15]] 14, wherein the instructions  
2 when executed cause the system to further store plural thresholds for corresponding plural call  
3 sessions.

1           17.   (Currently Amended) The article of claim [[15]] 14, wherein the instructions  
2 when executed cause the system to further calculate the predetermined threshold based at least in  
3 part on a frame size used in the call session.

1           18.   (Currently Amended) ~~The article of claim 14, wherein the instructions when~~  
2 ~~executed cause the system to further~~ An article comprising at least one storage medium  
3 containing instructions for protecting a first network, the instructions when executed causing a  
4 system to:  
5               determine if a rate of incoming data units from an external network to the first  
6 network exceeds a predetermined threshold;  
7               perform a security action if the determined rate of incoming data units exceeds the  
8 predetermined threshold; and  
9               determine if each incoming packet has a predetermined pattern.

1           19.   (Original) The article of claim 18, wherein the instructions when executed cause  
2 the system to determine if each incoming packet has the predetermined pattern by checking if  
3 each incoming packet has an indication of a predetermined codec type.

1           20.   (Cancelled)

1           21.    (Currently Amended) ~~The system of claim 20,~~ A system for use in  
2    communications between a first network and an external network, comprising:  
3                   a storage module to store a threshold value for a communications session, the  
4    threshold value representing an acceptable rate of incoming data units from the external network  
5    to the first network; and  
6                   a controller adapted to deny further entry of data units from the external network  
7    to the first network in the communications session in response to the controller detecting that the  
8    rate of incoming data units exceeds the threshold value,  
9                   the storage module to further store address information, wherein the controller is  
10   adapted to compare a source address of an incoming data unit with the address information  
11   stored in the system and to deny further entry of the incoming data unit if the source address does  
12   not match the address information stored in the system.

1           22.    (Original) The system of claim 21, wherein the address information comprises a  
2    network address translation table.

1           23.    (Original) The system of claim 22, wherein the network address translation table  
2    comprises a network address and port translation table.

1           24.    (Original) The system of claim 21, wherein the controller is adapted to further  
2    check if the incoming data unit contains a Real-Time Protocol or Real-Time Control Protocol  
3    payload, and to deny further entry of the incoming data unit if the incoming data unit does not  
4    contain a Real-Time Protocol or Real-Time Control Protocol payload.

1           25.   (Currently Amended) ~~The system of claim 20;~~ A system for use in  
2   communications between a first network and an external network, comprising:  
3               a storage module to store a threshold value for a communications session, the  
4   threshold value representing an acceptable rate of incoming data units from the external network  
5   to the first network; and  
6               a controller adapted to deny further entry of data units from the external network  
7   to the first network in the communications session in response to the controller detecting that the  
8   rate of incoming data units exceeds the threshold value,  
9               the storage module to further store a codec type for the communications session,  
10 wherein the controller is adapted to deny entry of an incoming data unit if the incoming data unit  
11 does not contain an indication of the codec type.
